

CHAPTER I

INTRODUCTION

BACKGROUND OF THE STUDY

Laziness is very common among teens recently. They spend the most of their time doing unproductive things. For example, surfing through social media or lying in bed. It sets off the process of becoming a slacker. Understanding unemployment as a kind of laziness shifts the attention away from the perceived harm unemployment poses to society, instead putting the responsibility on the individual. They must understand that if they have time and can make it highly beneficial, it might be referred to as self-reward. When individuals have a misunderstanding about self-reward, it becomes one of the factors that contribute to laziness. (Madsen, 2018).

During 2015 the number of international students studying in Russian universities increased by 14.1% and reached 186,606 (Malykhin, 2015). The number of foreigners enrolled at our universities, increased by 9.8% (up to 59,300), of which one in five (11,090) entered on state quotas, and the amount of those whose who entered on state quotas increased by 55.5% over the year.

According to statistics, most international students in Russia come from Kazakhstan (53,809 or 28.8%), followed by Belarusians (17,724 or 9.4%), Ukrainians rank third (15,978 or 8.5%), the top-five is closed by representatives from Turkmenistan (15,631 or 8.4%) and Uzbekistan (15,025 or 8%). The top-ten also includes Azerbaijani, Chinese, Tajiks, Moldavians and representatives of India (Gelbras, 2002). International students study in more than half of the today's 950 educational public and private higher education institutions in Russia. They contribute to the diversity and internationalization of academic and public activities. For example, these students bring different perspectives to problems in the classroom, enhance the mutual understanding and appreciation of the differences found around the world.

Therefore, it is important to accept international students in Russian universities, because of their contributions to the student society on so many various levels. These levels include academic prestige, cultural exchange and financial income. To begin with, international students are extremely important to the higher education of any country for both academic prestige and financial advantage. Thus, for example, it is found that students demonstrate a lot more interest in their studies, if they attend an academic institution enrolling a number of international students (Celleja, 2000). As a rule, international students are hard-working. In contrast to the Russian students most foreigners going to college are eager to learn. Almost all international students show a great desire to get straight A. The basic level of the subject skills of international and Russian students can be about the same, and sometimes it is even higher among the foreigners, because more hours may be provided for the academic discipline. Therefore, it is often international students who help Russian ones to understand the most complex issues. Russian students have more incentive to study the subject, which spurs a sense of competition with international students (Knyazeva et al., 2010). Thus, international students in some way enhance the academic performance of universities in which they study, because they show a good level of academic training. Especially, when the student's country sends him to study abroad, then there is quite a rigorous selection of candidates. Not only the applicant's performance in basic subjects is taken into account, but also his common cultural competence. In this case, the Russian university gets decent, academically prepared students. Even if they have a high rating in their countries, international students, however, must meet the requirements in language training. Namely, these students bring new ways of thinking and intensify competition in academic achievement.

In the Philippines, several researches related to academic procrastination frequency from different universities and state colleges were conducted. Mandap (2016) stated that procrastination has been very common in the university where students face a multitude of academic requirements such as examinations, assignments and research works. A study administered in Mapua Institute of Technology was driven by observed behavior of students when it comes to completing a particular task. Tagata and Que (2013) identified two behaviors of a student given a task; there are students who start a task when the deadline is fast approaching while there are students who, even when they start on time, they cannot finish the task at hand.

In a local perspective, the Department of Education (DepEd) was alarmed by the declining achievement rates of students in Davao Region. Simbulas (2014) conducted an inquiry on 163 first-year students from different high schools in Davao City to assess the correlation of their academic performance and their self-efficacy. Results show that self-efficacy was not significantly related to the academic performance of students in Algebra. A study conducted at Mindanao State University declares that the very reason why students indulge in procrastination is because of attributes such as poor time management, task aversiveness and fear of failure. Moreover, results show that there is a significant relationship established between the level of procrastination and the gender of the student respondents (Olea & Olea, 2015).

In regional context, in Malalag, a municipality in Davao del Sur, located in the southern part of Mindanao, faces a unique set of challenges that may contribute to student laziness. The town, while experiencing growth and development, remains largely agricultural with many families living in rural settings. Educational facilities in Malalag, like in many rural areas, often struggle with limited infrastructure, insufficient learning materials, and a shortage of qualified teachers. This can lead to a lack of academic stimulation and lower student motivation. A study conducted by Flores and Tan (2018) on the academic performance of

students in rural Davao del Sur found that students in areas like Malalag are significantly more likely to display behaviors such as procrastination, absenteeism, and lack of participation in class compared to their urban counterparts. According to the study, these behaviors are linked to factors such as a lack of parental involvement in school activities, poor learning environments at home, and the absence of positive role models. Many students in Malalag are also faced with the difficult reality of needing to help their families with farm work or other household duties, which further diminishes their time and energy for academic pursuits (Bautista, 2020).

Laziness, often characterized as a lack of motivation or willingness to engage in academic tasks, can significantly affect the academic performance of students, particularly in demanding fields in grade 12 students. The phenomenon of laziness in students is frequently linked to underlying issues such as stress, anxiety, and procrastination. Research indicates that what is often labeled as laziness may actually be a symptom of deeper psychological challenges. For instance, students who exhibit laziness may be struggling with mental health issues, burnout, or a lack of intrinsic motivation, which can hinder their academic performance. In the context of grade 12 students' education, where the curriculum is rigorous and demanding, the implications of laziness can be particularly pronounced. Grade 12 students often face high expectations and workload, leading to increased stress levels.

This stress can manifest as procrastination, which further exacerbates feelings of laziness. Academic performance is more likely to procrastinate and exhibit lazy behaviors, which in turn negatively impacts their grades and overall academic success. Moreover, the relationship between laziness and academic performance is complex. While laziness can lead to poor academic outcomes, it is also influenced by factors such as time management skills, self-efficacy, and the learning environment. High-performing students tend to prioritize their studies and manage their time effectively, whereas those with lower performance levels may struggle with these aspects, leading to a cycle of procrastination and perceived laziness.

The common problem of grade 12 students is a lack of understanding of the purposes and meaning of schooling, as well as unawareness of the importance of school education. Another reason is reduced psychophysiological alertness, which can contribute to decreased motivation and engagement in learning. Additionally, a low level of motivating attention from teachers can also lead to educational laziness among students. Factors such as being overwhelmed with assignments, ineffective learning methods, social environment, excessive use of cellphones and social media, and poorly organized classrooms can also contribute to students' laziness in learning. Furthermore, the lack of rewards for studying hard and taking rigorous courses, as well as the zero-sum nature of academic competition and the absence of school-sponsored recognition for academic achievements, can demotivate students and contribute to their laziness in school.

The purpose of this study is to critically examine the concept of laziness and its impact on individuals and society. By delving into the definition and underlying causes of laziness, the study aims to provide a comprehensive understanding of this behavioral trait and its implications. Additionally, the scope of the study encompasses an exploration of the psychological, social, and economic factors that contribute to laziness, as well as potential interventions and strategies for overcoming it. Through a multidisciplinary approach, the study seeks to offer valuable insights into the complex nature of laziness and its significance in various contexts, ultimately contributing to the existing body of knowledge on human behavior and motivation. This research will provide a nuanced perspective on the role of laziness, shedding light on its complexities and offering practical implications for individuals, professionals, and policymakers.

STATEMENT OF THE PROBLEM

This study aims to explore the laziness of grade 12 students that affect their academic performance in Mary Mediatrix of All Graces Academy, Inc. Mainly this pursued to answer the following questions.

1. What is the level of factors that contribute to laziness of grade 12 students of Mary Mediatrix of All Graces Academy, and how do these factors affect their academic performance?
 - 1.1. Procrastinate and Stress
 - 1.2. Capability and Defining
 - 1.3. Negative mindset and Learned Helplessness
2. What is the level of intervention that can effectively reduce laziness and improve academic performance in grade 12 students Mary Mediatrix of All Graces Academy disciplines?
 - 2.1. Curriculum Enhancement
 - 2.2. Teacher and Training Support
 - 2.3. Critical Thinking Programs
3. What is the level of strategies that students use to overcome laziness and improve their academic performance?
 - 3.1. Develop Time Management Skills
 - 3.2. Foster Intrinsic Motivation
 - 3.3. Maintain a Healthy Lifestyle

SCOPE AND DELIMITATION

The scope of this study aims to determine the Laziness of grade 12 students that affect their Academic Performance in Mary Mediatrix of All Graces Academy, Inc. The researchers aim to conduct a face-to-face survey using papers to record the respondents' answers, which are the grade 12 students of Mary Mediatrix of All Graces. The students, in grade12 with the maximum of 50 students at Mary Mediatrix of All Graces of the Academy

are the responses. The focus of this research study is on student laziness and how it affects students' academic performance. To assess the respondents' laziness and how it affects their academic performance, a survey will be given to them

SIGNIFICANCE OF THE STUDY

A study on the impact of laziness on the academic performance of grade 12 students in Mary Mediatrix of all Graces Academy, Inc. would be significant in determining how laziness behavior affects the educational achievement of a student. The result of the research will benefit the following:

Students. It will help students to be aware of how laziness behavior affects their academic achievement and may see an improvement in their grades and overall academic performance, leading to better opportunities for higher education and future careers.

Educators. Teachers and academic advisors can use the research findings to develop targeted interventions and support programs aimed at addressing laziness and fostering better study habits.

Researchers. It helps us researchers to know more about how laziness behavior will affect our academic achievement.

Future Researchers. It benefits them, so they all instantly be guided and go over the research we have conducted about the impact of laziness behavior affecting the academic performance of a student.

Educational Institutions. Schools and universities can use the findings to inform policies and practices that address student laziness, potentially incorporating new support structures or revising existing ones.

Parents and Guardians. Parents and guardians can gain insights into how they can better support their children in overcoming laziness and fostering a productive study environment at home.

Null Hypothesis

The null hypothesis was tested at 0.05 level of significance using appropriate statistical tool.

H₀₁. There is no significant relationship between the level of factor contribute laziness on academic performance of the Grade 12 student of Mary Mediatrix Of All Graces Academy, Inc.

H₀₂. There is no significant relationship between the level of interventions that can effectively reduce laziness and improve academic performance of the grade 12 students Mary Mediatrix of All Graces Academy, Inc.

H₀₃. There is no significant relationship between the level of strategies that students use to overcome laziness and improve their academic performance of the grade 12 students Mary Mediatrix of All Graces Academy, Inc.

CONCEPTUAL FRAMEWORK

The study's independent variable is the level of laziness which causes the grade 12 students affecting their academic performance.

Meanwhile the dependent variable is the level of laziness with indicators: Negative Mindset and Learned Helplessness, Strategies to Overcome Laziness, Curriculum Enhancement, and Developing Time Management Skills. The first indicator is Negative Mindset and Learned Helplessness, where when individuals develop a sense of powerlessness and resignation, then may struggle to overcome feelings of inertia and lack of motivation, the second indicator which is Strategies to Overcome Laziness, involve addressing both the underlying cause of

procrastination and cultivating a proactive mindset, the third indicator is Curriculum Enhancement, which address issues related to laziness involves incorporating motivational strategies and fostering a growth mindset among students, and the last indicator which is Developing Time Management Skills, the process of deciding on the sequence in which you will complete chores and ensuring that they are completed on time (Collins English Dictionary, 2019).

The research is focused on the impact of laziness on the academic performance of the grade 12 students of Mary Mediatrix of All Graces Academy, Inc.

Conceptual Framework of the Study

Laziness behavior of the Grade 12 students in Mary Mediatrix of All Graces Academy.

Figure. 1 The Conceptual Paradigm of the Study

THEORETICAL FRAMEWORK

As school works and other work-related arises, distraction like social media, video games and anxiety to process a task due to many reasons which included the fear of judgment could result to deployment or procrastination. Students of Mary Mediatrix Of All Graces Academy, Inc students experience these kind of phenomenon, these is the primary reason of the researchers to conduct these research study. The Temporal Motivational Theory is the major theoretical underpinning of this research investigation. The Procrastination Equation (also known as Temporal Motivation Theory) is a relatively new development in the field of motivational research that acts as an integrative theory from which most other motivational theories can be derived. It shows that the following equation may be used to illustrate why people make decisions: $\text{Motivation} = \frac{\text{Expectancy} \times \text{Value}}{1 + \text{Impulsiveness} \times \text{Delay}}$ (Steel, 2014).

Expectancy theory states that motivation increases when people are confident of receiving a desired reward or outcome (i.e., expectancy) (i.e., value). However, according to behavioral decision theory and need theory, when a reward is obtained after a lengthy time (i.e., a delay), motivation is reduced, and humans are sensitive to delays (i.e., impulsiveness). When the delay is effectively zero, the constant "1" is included to protect the equation from becoming infinite (Steel et al., 2018).

According to the temporal motivation theory, time has a substantial influence on motivation. Consider a student who only has one month to study for a final exam. For the month, the student has two options: study or socialize. Although the student prefers to socialize, he or she must also excel academically. During the beginning of the student's study period (when there is a considerable gap before the deadline), the reward of studying is not immediate (and hence has low value); thus, the desire to study is lower than the desire to socialize. However, when the study period shortens from weeks to days, the desire to learn will take precedence over the desire to socialize (Monroe & Amidon, 2021).

In addition, the researchers used Walberg's theory of academic performance for our criterion which is level academic performance in terms of cognitive, behavioral and attitudinal to support the study. According to Walberg's theory of academic accomplishment, individual students' psychological qualities and their immediate psychological circumstances have an impact on educational outcomes (Rugutt & Chemosit, 2005). The researchers believe that Walberg's theory could help in determining whether procrastination does have a great impact on the academic performance of the student.

DEFINITION OF TERM

Laziness - is often defined as the avoidance of work or exertion despite having the capacity to engage in tasks or responsibilities. In psychological terms, it can be linked to procrastination, lack of motivation, or avoidance behavior. One example of a definition around 2015 comes from a psychological perspective, where laziness was examined in the context of self-control and motivation. According to Duckworth et al. (2015), "Laziness is a failure of self-regulation in which an individual fails to initiate or persist in a goal-directed activity despite having the ability and resources to do so" (Duckworth et al., 2015).

Academic performance - refers to the degree to which a student meets the standards and expectations of their educational institution. It is typically measured through grades, test scores, assignments, and overall achievement in academic tasks. Factors influencing academic performance can include cognitive abilities, motivation, study habits, and socio-environmental influences. A study by Schunk and Zimmerman, which suggests that "academic performance involves the demonstration of knowledge, skills, and abilities as assessed through various academic tasks" (Schunk & Zimmerman, 2015).

Grade 12 students - Laziness in students, particularly among grade 12 students, can significantly affect their academic performance. This type of laziness often manifests as procrastination, lack of motivation, and avoidance of tasks, leading to poor time management, incomplete assignments, and suboptimal exam performance. A relevant study that examines this in the context of students is by Steel (2015), who discusses how procrastination, often linked to laziness, negatively impacts students' academic performance. Steel suggests that "students who procrastinate tend to avoid academic tasks, resulting in lower grades and higher stress levels" (Steel, 2015). This aligns with how laziness and procrastination contribute to academic underperformance in senior high school students.

CHAPTER II

REVIEW OF RELATED LITERATURE

A related review of Literature (RRL) is a detailed review of existing literature related to the passage of a thesis or dissertation. In this chapter, research studies reveal the impact of laziness on the senior high students. This section also includes a review of the research on the variables and indicators used in this study. These include the following: Intervention to reduce laziness, Negative mindset and learned helplessness, Strategies to overcome laziness, Developing time management skills.

INTERVENTIONS TO REDUCE LAZINESS

Reducing laziness often requires targeted interventions that enhance motivation and build effective habits. One approach is to apply behavioral strategies, such as goal setting, to foster accountability and a sense of purpose. The SMART criteria (Specific, Measurable, Achievable, Relevant, Time-bound) for goal-setting is particularly effective. According to

Doran (2017), this method not only clarifies objectives but also allows individuals to track their progress, leading to increased motivation and reduced procrastination.

Another intervention involves creating structured routines. Research by Fogg (2015) emphasizes the importance of "tiny habits," which encourages individuals to start with small, manageable tasks. By integrating these small actions into daily routines, individuals can build momentum and gradually take on larger challenges. This approach aligns with the idea of "behavioral activation," which focuses on engaging in activities that can improve mood and motivation, thereby combating feelings of laziness (Martin et al., 2017).

Additionally, leveraging social support can significantly influence motivation. Engaging friends or family members in shared goals can create a sense of accountability. Studies indicate that social interactions can enhance commitment and provide encouragement, which are critical components in overcoming inertia (Smith et al., 2016).

In summary, interventions aimed at reducing laziness can be multifaceted, incorporating goal-setting techniques, the establishment of structured routines, and the utilization of social support systems. These strategies collectively work to enhance motivation and promote more productive behaviors.

NEGATIVE MINDSET AND LEARNED HELPLESSNESS

A negative mindset and learned helplessness can significantly impact one's perception of laziness. When individuals develop a sense of powerlessness and resignation, they may struggle to overcome feelings of inertia and lack of motivation. This can create a cycle where the belief of being unable to change leads to a defeatist attitude towards productivity and personal growth. It's essential to address these negative thought patterns and cultivate a more positive and proactive approach to break free from the cycle of learned helplessness and combat feelings of laziness. Negative mindset and learned helplessness

related to laziness can significantly impact one's motivation and productivity (Dweck, 2015). This combination of factors can create barriers to personal growth and hinder individuals from reaching their full potential. It's essential to address these issues through positive reinforcement and a growth mindset to overcome the challenges associated with feeling lazy or unmotivated.

STRATEGIES TO OVERCOME LAZINESS

Strategies to overcome laziness involve addressing both the underlying causes of procrastination and cultivating a proactive mindset. In a study by O'Donoghue and Rabin (2015), they emphasize the importance of setting specific, achievable goals, breaking tasks into smaller steps, and maintaining a routine. Additionally, creating a conducive environment, managing distractions, and practicing self-discipline are key strategies to combat laziness and enhance productivity. By implementing these approaches consistently, individuals can overcome inertia and develop a more motivated and focused work ethic. One effective strategy to overcome laziness is to break tasks into smaller, more manageable steps, known as "chunking." This approach helps reduce feelings of overwhelm and makes it easier to get started on tasks. By focusing on completing one small step at a time, individuals can build momentum and gradually increase their productivity (Clear, 2017). Additionally, setting specific, achievable goals and establishing a routine can help create a sense of structure and motivation in tackling tasks (Clear, 2017). Implementing these strategies can gradually shift mindset and behaviors away from laziness towards a more proactive and goal-oriented approach.

CURRICULUM ENHANCEMENT

Enhancing the curriculum to address issues related to laziness involves incorporating motivational strategies and fostering a growth mindset among students. By emphasizing the importance of effort and perseverance, educators can help students overcome feelings of laziness and develop a more proactive approach to learning. Research by Dweck (2015) highlights the significance of promoting a growth mindset, where students believe that their abilities can be developed through dedication and hard work. This approach can empower students to view challenges as opportunities for growth and success, ultimately combating laziness and promoting a more engaged and motivated learning experience.

DEVELOPING TIME MANAGEMENT SKILLS

Developing time management skills is a key strategy for overcoming feelings of laziness. By creating a schedule, setting specific goals, prioritizing tasks, and breaking them down into manageable steps, individuals can effectively structure their time and stay motivated to accomplish their objectives. This approach helps in combating laziness by providing a clear roadmap for tasks and fostering a sense of productivity and achievement. Time management skills can help overcome laziness by creating structure and reducing procrastination. For example, a person who struggles with laziness might find it helpful to use the Pomodoro Technique, which involves working in 25-minute intervals with short breaks in between. This technique can help break down tasks into smaller, more manageable chunks, making them less daunting and increasing motivation to start working. By scheduling specific times for work and breaks, the individual can create a routine that helps them stay on track and avoid getting bogged down in procrastination. Implementing structured time management strategies, such as to-do lists and goal setting, can help mitigate these issues, leading to improved academic outcomes. Understanding the root causes of laziness is crucial for fostering a supportive learning environment. Laziness can significantly affect the time

management skills of students. Research shows that social laziness, which is influenced by factors like self-efficacy and success motivation, can lead to poor time management behaviors. Additionally, the flexibility and freedom in university environments can exacerbate time management issues for students who struggle with laziness. Laziness is not solely an individual attribute but is also a social phenomenon influenced by socio-cultural contexts, including perceptions of time and societal categorizations of behaviors as lazy. Service-learning programs have been implemented to combat declining citizenship behaviors among students, aiming to enhance management skills through experiential learning and community service. Therefore, addressing laziness through interventions and promoting a proactive approach to time management can help students improve their overall academic performance and achievements.

THE IMPACT OF LAZINESS ON THE ACADEMIC PERFORMANCE OF GRADE 12 STUDENTS

A QUANTITATIVE RESEARCH PRESENTED TO THE FACULTY OF SENIOR HIGH SCHOOL IN MARY MEDIATRIX OF ALL GRACES ACADEMY, INC. CORNER MABINI, STA. ANA AVE., SAN MIGUEL, DIGOS CITY

CHAP III

METHODOLOGY

Methodology is the philosophical framework within which the research is conducted or the foundation upon which the research is based (Brown, 2006) This chapter describes the methodology employed by the present student and the rationale behind that were taken. Covered in the following areas in this chapter: research design, research locale, sampling technique, research instrument, data gathering, and statistical treatment of data.

RESEARCH DESIGN

This study uses the Descriptive-Survey Research Design. In this design, the researcher will collect the data of the dependent through the survey to describe the impact of laziness behavior on the academic performance of grade 12 in Mary Mediatrix of all Graces academy, inc. We used Descriptive-Survey as our Research Design because our research only contains one problem. Descriptive research aims to systematically describe characteristics, behaviors, or relationships without manipulating variables, while exploratory research seeks insights and hypothesis generation in less understood areas. Descriptive research design is a powerful tool used by scientists and researchers to gather information about a particular group or phenomenon. This type of research provides a detailed and accurate picture of the characteristics and behaviors of a particular population or subject. By observing and collecting data on a given topic, descriptive research helps researchers gain a deeper understanding of a specific issue and provides valuable insights that can inform future studies.(Sirisilla, 2023.)

RESEARCH LOCALE

This study is conducted at Mary Mediatrix of All Graces Academy incorporated. The respondents will be interviewed in their perspective rooms or any comfortable place that the respondent will choose. These respondents will be interviewed via face-to-face. The researchers choose the place of implementation because it will give the researchers the needed information for students who have laziness issues. The study will be conducted in the second semester of the academic year 2024-2025

SAMPLING TECHNIQUE

Stratified random sampling is particularly effective for studying the impact of laziness on academic performance because it ensures representation from various subgroups within a population. This method enhances the accuracy of results by minimizing bias and allowing for meaningful comparisons between different strata, such as students with varying levels of academic engagement. It is beneficial in heterogeneous populations, as it provides a systematic way to capture the diversity of characteristics relevant to the study. By ensuring adequate representation of all identified subgroups, researchers can draw more reliable conclusions about the relationship between laziness and academic performance. Del Siegle, Ph.D., emphasizes the effectiveness of stratified random sampling in educational research, stating that it allows for a representative selection of subjects from various subgroups, which is crucial for obtaining accurate results. This method ensures that samples reflect the population's diversity, thereby reducing bias and enhancing the reliability of findings related to factors like laziness and academic performance. Additionally, research indicates that stratified

sampling can lead to stronger research outcomes by systematically capturing demographic variations within the study population.

RESEARCH INSTRUMENT

This study will be using an adapted A type of research questionnaire. The questionnaire was developed based on the study's objectives. The questionnaire consisted of ninety (90) questions. The questionnaire consisted of items justifying the Impact of Laziness on academic performance. This research employed a quantitative approach with modified questionnaires to get the numerical data from respondents. The researcher prepared their own questionnaire. The draft of the questionnaire was drawn out based on their readings, reviewed published and unpublished thesis relevant to the study. The researchers saw that there were enough items to collect data to cover all aspects of the problem and to answer all the specific questions under the statement of the problem. Then, the researcher submitted the questionnaire to the adviser for correction after which it was finalized.

For validation purposes the copies of questionnaire were given to two of the Mary Mediatrix Of All Graces Academy, Inc Teachers to validate the self-made questionnaire. After they had validated the copies, these persons were interviewed by the researcher to find out their assessments of the questionnaire. They were asked if all the items were clear and unequivocal to them; if the number of items were adequate enough to collect data pertinent to the study; if all the items were objective and not biased; and if all items were relevant to the research problem. Afterwards the items in the questionnaire were revised for more clarity and definiteness.

The copies of the questionnaires were then distributed personally by the researcher to the respondents.

RANGE INTERVAL	SCALE	DESCRIPTION	DESCRIPTIVE EQUIVALENT
4.50 - 5.00	5	Very High	This indicates that the respondents experience the level of laziness is very high
3.50 - 4.49	4	High	This indicates that the respondents experience the level of laziness is high
2.50 - 3.49	3	Average	This indicates that the respondents experience the level of laziness is average
1.50 - 2.49	2	Low	This indicates that the respondents experience the level of laziness is low
1.0 - 1.49	1	Very Low	This indicates that the respondents experience the level of laziness is very low

RANGE INTERVAL	DESCRIPTION	DESCRIPTIVE EQUIVALENT
90 - 100	Outstanding	This indicates that the respondents have an excellent focus on their studies.
85 - 89	Very satisfactory	This indicates that the respondents have a very good performance in their studies.
80 - 84	Satisfactory	this indicates that the respondents have a good performance in their studies
75 - 79	Fairly Satisfactory	this indicates that the respondents have an improvement in their studies
75 below	Failed	this indicates that the respondents have a need to focus in their studies and improve more

DATA GATHERING PROCEDURE

In gathering the data that is required in this study, researchers will follow every step enumerated below.

1. Asking the permission of the Principal, Teachers and School Administrator to conduct this study legally
2. Must write an invitation letter to the respondents to participate in this study
3. Conduct a test for the Grade 12 students of Mary Mediatrix Of All Graces Academy Inc
4. Must retrieve the test questionnaires
5. Correcting the tests after some retrieval
6. Describing the results of the survey conducted on the impact of laziness on the academic performance of senior high school students in Mary Mediatrix Of All Graces Academy Inc.

STATISTICAL TREATMENT OF DATA

To analyze and interpret the data, the researchers tally the answers of the Grade 12 students of Mary Mediatrix Of All Graces Academy, Inc and use various statistical treatment including the following:

1. Weighted Mean

It is used to know the average of all the answers of respondents regarding the statements given in the questionnaire.

2. Scale Interval

It is used to analyze the answers of the respondents and interpret the result of the survey which uses the following conditions:

1.0-1.49 Strongly Disagree

1.50-2.49 Disagree

2.50-3.49 Moderately Agree

3.50-4.49 Agree

4.50-5.00 Strongly Agree

3. Frequency Distribution

It is a table that shows the distribution of the respondents depending on their profile variables

4. t -Test for Independent Sample

This test is used to indicate the answer to the hypothesis given previously.

5. F - test (ANOVA)

This test will be used to compare and identify the significant differences between the answers of the respondents from three or more groups.
